The e-book series titled CrMS: The Online Learning Platform for Colleges and Universities, which provides a comprehensive guide to designing and implementing an online learning environment within the context of a higher education setting.Q: Count occurrences of specific word in string in python I have a string that looks like this: mystr = "blahblahblahHere's some_content1_and_stuff_that_might_not_be_what_you_are_looking_forblahblahblahThere are some words in here that mean something" What I want to do is take the string and identify the words that mean something and count how many there are. In this case, it would return something like this: words = ['here','stuff', 'and'] word_count = [1, 1, 0] The problem is I don't know how to approach this with python since it seems like a pretty easy thing to do but I haven't been able to find a solution. A: Here's a way to do it. string = "blahblahblahHere's some_content1_and_stuff_that_might_not_be_what_you_are_looking_forbl
